

Anatomic ACL repair:

# DB For all or for selected patients?

Professor Lars Engebretsen MD  
PhD

**Study Design:**

**An active-controlled randomized noninferiority study**

**The goal of this study:**

**The goal is to compare the two techniques: single bundle hamstrings versus double bundle hamstrings using the KOOS score Quality of life (QoL) as the primary outcome.**

**As secondary outcomes clinical examinations and standing radiographs (Kellgren Lawrence method) after 1,2 and 5 years**

**Questions to be answered**

- Is there a difference between double-bundle and single-bundle technique in the KOOS score?
- Are there differences between hamstrings single bundle and double bundle technique when the Lachman test and the pivot shift test are being used?
- Is there a difference between hamstrings double-bundle technique and single-bundle technique in return to sports?
- Are there differences between double-bundle technique and single-bundle technique in functional tests (one-leg hop and tre leg side jump)?
- Is there a difference in the development of osteoarthritis between the two techniques?

**Patients & Methods**

**Patients**

- 150 patients age 18-40 with an ACL injury will be envelope- randomized in the OR after the injury has been established arthroscopically to either the "double-bundle" or the "single-bundle" technique i.e. 75 patients in each group. The patients will have had a rehabilitation period preoperatively for 4 months prior to inclusion**

**Inclusion criteria**

- Clinically verified ACL rupture (history, Lachman test 2+ or more with no endpoint; pos pivot shift and arthroscopically verifies), MRI pos.

**Exclusion criteria**

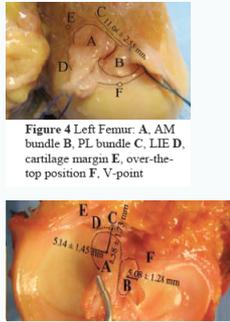

- PCL injury,
- ACL injury to the contra lateral knee
- > 1+ medial or lateral-posterolateral ligament injury,
- previous ACL reconstruction,
- meniscal injury leaving < 50% of the meniscus intact
- established OA as judged by Kellgren 3-4
- Graft size < 6 mm

**TABLE 1 Quantitative Relationships of the Centers of the ACL and the AM and PL Bundles to Landmarks on the Femur**

Relationship	Distance* (mm)
<b>Distance of the femoral ACL center to:</b>	
Lateral intercondylar for ridge	6.1 ± 1.8
Lateral intercondylar for ridge midpoint	6.8 ± 1.5
Bifurcate ridge	1.7 ± 0.8
Bifurcate ridge midpoint	2.2 ± 1.1
Distal cartilage margin	14.7 ± 1.9
Proximal cartilage margin	8.5 ± 1.9
Vertical point	10.0 ± 2.3
ACL insertion border	10.5 ± 1.4
ACL insertion border	9.9 ± 1.7
<b>Distance of the AM bundle center to:</b>	
Lateral intercondylar for ridge	7.1 ± 2.0
Lateral intercondylar for ridge midpoint	9.1 ± 1.9
Bifurcate ridge	4.7 ± 0.9
Bifurcate ridge midpoint	5.9 ± 0.9
Distal cartilage margin	18.0 ± 1.9
Vertical point	15.1 ± 1.6
PL bundle center	10.0 ± 1.1
ACL center	5.2 ± 1.5
ACL insertion border	6.9 ± 0.9
ACL insertion border	14.5 ± 1.8
<b>Distance of the PL bundle center to:</b>	
Lateral intercondylar for ridge	4.1 ± 2.1
Lateral intercondylar for ridge midpoint	6.1 ± 2.2
Bifurcate ridge	5.2 ± 1.4
Bifurcate ridge midpoint	5.7 ± 1.6
Distal cartilage margin	11.1 ± 1.7
Proximal cartilage margin	5.7 ± 1.1
Vertical point	6.0 ± 1.3
ACL center	5.2 ± 1.5
ACL insertion border	14.6 ± 1.8
ACL insertion border	6.4 ± 0.9

\*The values are given as the mean and standard deviation. Anteromedial = AM, Posterolateral = PL.

**Multiple Landmarks for Tunnel Positioning in Double-Bundle ACL Reconstruction**  
 Joseph J. Denham, MD, PhD, Andrew G. Trudell, MD, PhD, Robert J. Williams, MD, PhD, Robert J. Williams, MD, PhD, Robert J. Williams, MD, PhD

**OBJECTIVE:** To determine the accuracy of double-bundle ACL reconstruction using multiple landmarks for tunnel placement.

**DESIGN:** Retrospective study.

**SETTING:** Level 1 trauma center.

**PATIENTS:** 100 patients who underwent double-bundle ACL reconstruction.

**MEASUREMENTS AND MAIN RESULTS:** The accuracy of tunnel placement was measured using multiple landmarks. The results showed that the use of multiple landmarks improved the accuracy of tunnel placement compared to single landmarks.

**CONCLUSIONS:** The use of multiple landmarks for tunnel placement in double-bundle ACL reconstruction improved the accuracy of tunnel placement.

**TABLE II Quantitative Relationships of the Centers of the ACL and the AM and PL Bundles to Landmarks on the Tibia**

Relationship	Distance* (mm)
Distance of the tibial ACL center to Anteromedial tubercle	10.4 ± 1.9
Anteromedial ridge midpoint	10.5 ± 1.6
Anteromedial aspect of anterior horn of lateral meniscus attachment	10.2 ± 1.7
Posterior/lateral aspect of anterior horn of lateral meniscus attachment	8.5 ± 1.6
Posterior horn of lateral meniscus	15.7 ± 1.8
Posterior-most aspect of anteromedial fossa	10.2 ± 1.4
Lateral tibial eminence	11.0 ± 1.4
Retroeminent ridge	11.0 ± 1.4
Lateral plateau cartilage border	11.7 ± 1.6
Medial plateau cartilage border	7.9 ± 1.1
Anterior ACL bundle	10.9 ± 1.8
Posterior ACL bundle	9.9 ± 2.3
Distance of the tibial ACL bundle center to Anteromedial tubercle	7.1 ± 1.6
Anteromedial ridge midpoint	7.6 ± 1.3
Anteromedial aspect of anterior horn of lateral meniscus attachment	13.3 ± 1.9
Posterior/lateral aspect of anterior horn of lateral meniscus attachment	14.1 ± 1.8
Posterior horn of lateral meniscus	17.8 ± 2.6
Posterior-most aspect of anteromedial fossa	10.6 ± 1.6
Lateral plateau cartilage border	8.8 ± 1.1
Medial plateau cartilage border	7.8 ± 1.9
Anterior ACL bundle	11.9 ± 2.4
Posterior ACL bundle	10.1 ± 1.3
ACL center	13.1 ± 1.1
Distance of the tibial PL bundle center to: Anteromedial tubercle	4.9 ± 1.7
Anteromedial aspect of anterior horn of lateral meniscus attachment	10.8 ± 2.2
Posterior horn of lateral meniscus	7.5 ± 1.6
Posterior-most aspect of anteromedial fossa	3.9 ± 1.3
Retroeminent ridge	3.4 ± 2.1
Lateral plateau cartilage border	10.3 ± 2.1
Medial plateau cartilage border	8.5 ± 1.5

\*The values are given as the mean and standard deviation. Anteromedial = AM; Posterolateral = PL.

**TABLE I Quantitative Relationships of the Centers of the ACL and the AM**

**TABLE II Quantitative Relationships of the Centers of the ACL and the PL**

Relationship	Distance* (mm)
Distance of the tibial ACL center to Anteromedial tubercle	10.4 ± 1.9
Anteromedial ridge midpoint	10.5 ± 1.6
Anteromedial aspect of anterior horn of lateral meniscus attachment	10.2 ± 1.7

Retroeminent ridge	3.4 ± 2.1
Lateral plateau cartilage border	10.3 ± 2.1
Medial plateau cartilage border	8.5 ± 1.5

\*The values are given as the mean and standard deviation. Anteromedial = AM; Posterolateral = PL.

**Knee laxity:**

- Manual Lachman, graded as: 0, + (< 5 mm), ++ (5-10 mm) or +++ (> 10 mm) compared to the normal knee
- KT 1000 arthrometer, using 134 N anterior drawer as well as manual maximum test (MMT)
- Pivot shift, graded as: 0, +, ++ or +++ compared to the normal knee

**Range of motion (ROM)** measured in flexion and extension using a goniometer

RSA in a selected group (12) to measure rotations

**Functional tests:**

- One leg hop, best of 3 attempts and compared to the normal side
- Zig-zag test from side to side along a 6 meter parallel line comparing injured and normal side
- Knee walking test; 4-grade scale; OK, uncomfortable, painful very painful

**Activity level:** is graded using the Tegner score, 0-4 representing activities in daily life and 5-10 sport at various levels

**Subjective evaluation:**

- KOOS score. Best result is 100 points
- IKDC 2000 (International Knee Documentation Committee)

**Radiographic follow up:**

- These will be judged according to the Kellgren-Lawrence scale using a specific standing x-ray technique. The radiographs will be read by a blinded, experienced radiologist

**MRI dgEMRIC** in a subgroup of 12 patients pre and post

- Sort out referred patients
- Polyclinic: Inclusion criteria, X-ray, KT1000, consent form, questionnaire (KOOS, IKDC, Tegner-score), receive questionnaire, tests
- 1-2 weeks, Physiotherapist: consent form, answer questions, receive questionnaire, tests
- Operation: Envelope block randomize after arthroscopy; SB/DB, standardized operation description
1. Year, physiotherapist (blinded): x-ray, tests, questionnaire, KT1000
2. Year, physiotherapist (blinded): x-ray, tests, questionnaire, KT1000

- **The patients will be followed by the PhD student and the study coordinator. The randomization will start approximately October 1<sup>st</sup>. The group sees approximately 300 ACL injuries per year, so the inclusion should last approximately 12 months.**
- **The patients will be followed for 12, 24 and 60 months.**

Conclusion:

At this stage there is not enough evidence to establish firm selection criteria for DB ACL reconstruction
