Unicompartmental Knee Replacement

Renewed interest worldwide

SKAR 1998 - 2007

Uni versus HTO

Stukenberg-Colsman S., Knee 2001

62 pat., rand. prospective, 7 to 10 years survival rate: 77% Uni, 66% HTO

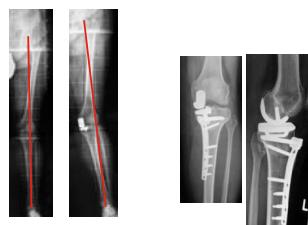

Good/excell Knee Soc. score: 65% Uni, 71% HTO

Broughton (jbjs 86)
Uni 76% good, 3/42 revised
HTO 43% good, 10/49 revised
Longer f-up: 42% good for uni,
21% good for HTO
→ younger active patients HTO,
→> 50-55, inactive: hemi

Uni after HTO ?

- Rees (jbjs 01) loosening increased:
 - 3.1% revision after uni
 - 27.8% revision after uni and previous HTO
 → Don't do it

TKA or Uni ?

Callaghan (corr 95): meta analysis usa

2,391 uni: knee rating 80.9

- Complication rate 18 %
 - Revision rate 9.2 %
- 884 tka rating: knee rating 78.3
- Complication rate 30%
 - Revision rate 7.2%

Robertsson (acta scand 99) (swedish registry)

- Revision rate tka = 12 %, uni = 16%,
- Less serious complications uni
- Uni cheaper

TKA or Uni ?

Newman (jbjs 98, jbjs 2009): 15 yr f-up **RCT** uni vs tka

- Uni: less morbidity perioperative
- Rapid regaining motion
- Sooner discharge hospital
- More excellent results (even after 15 years)

Yang (04): uni vs tka (50/50 matched pair)

- Less blood loss
- Quicker rehab, earlier ambulation,
- Shorter hospital stay
- Cheaper
- Better flexion (120 degr vs 110)

Uni Fixed Bearing Survival

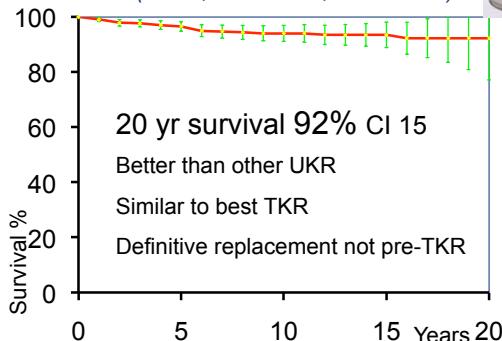

Year	Authors	Compartment	Prosthesis	Number	Survival rate (%) (95% CI) 10-year	15-year
1992	Capra and Fehring [32]	Medial/lateral	Marmor	52	94 (?)	—
1993	Heck et al.[33]	Medial/lateral	Marmor	294	91 (86-97)	—
1996	Cartier et al.[34]	Medial/lateral	Marmor	207	93 (81-100)	—
1998	Tabor and Tabor [35]	Medial/lateral	Marmor	67	84 (?)	79 (?)
1999	Squire et al. [36]	Medial/lateral	Marmor	140	89 (84-95)	87 (78-95)
1991	Weiler [37]	Medial	St Georg	548	80 (?)	—
1994	Weale and Newman [38]	Medial	St Georg	42	90 (?)	88 (?)
1997	Anvari et al. [39]	Medial	St Georg	461	87 (81-93)	—
1991	Scott et al. [40]	Medial/lateral	Brighton	100	85 (67-99)	—
1998	Hanegawa et al. [41]	Medial	PCA	77	88 (?)	—
1998	Bert [42]	Medial	MBUKA	100	87 (?)	—
1999	Berger et al. [43]	Medial/lateral	Miller-Galante	62	98 (96-100)	—
2000	Argenson et al. [44]	Medial	Miller-Galante	160	94 (91-97)	—

? Confidence intervals not published.

Uni mobile bearing (Svard, JBJS 2001, AAOS2006)

Oxford age < 60yrs (mean 55, n=52, Price et al JBJS2005)

Oxford <50yr, 7 centre study

Oxford 10 year survival: (Phase 1, 2, 3)

Surgeon	Year	Number	Lost	Survival
Keyes	2005	40	0	100%
Goodfellow	1998	144	1	98%
Scott	2004	135	0	94%
Svard	2005	439	0	94%
Emerson	2007	55	0	85%
Vorlat et al	2005	149	18	84%
Dodd, Murray	2009	1000	0	96%

Fixed versus mobile ?

Robertson (jbjs 01)

- Oxford / pca / georg sled
- More difficult technique: more reoperations oxford
- Pca inferior design
- St Georg Sled FB design: good results

Lewold (j arthr 95)

- Oxford vs marmor: more revisions after 6 years for oxford

13

Fixed versus mobile ?

Gleeson (knee 04): oxford vs st georg

- 3:47 dislocations oxford, 4 revisions
- 3:47 georg sled revisions
- Better pain relief georg

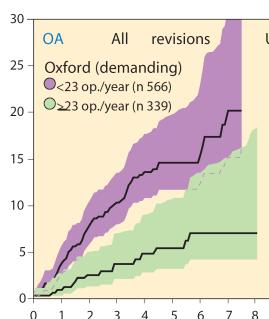

Confalonieri (Knee 04): RCT AMC vs. Allegretto

- No differences in outcome or complications after 5 years

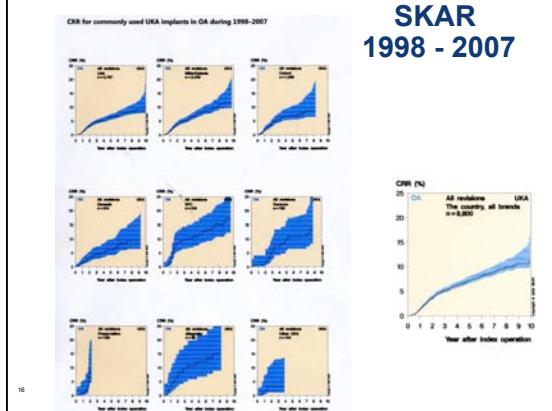

→MB series less wear, better survival, possible dislocation bearing, less forgiving

14

17

National Registers

- SKAR 2001 → number per centre → ↑ Survival
- SKAR 2007 – 92% at 10yrs,
 - 1995 Worst, 2007 Best – Experience/Training
- NZJR 2005 ↑ number per surgeon → ↑ results
 - >10 per year → 0.5% failure per year
- UKJR 2008 – 0.7% failure per year (incomplete reporting)
 - 2x better than ANJR – Course & centre size
 - Dislocation 0.2%. Death & Infection half of TKR

Complications Uni

Fracture tibia

- Berger (corr 99): 4.8%
- Related to 3 pins in medial tibia cortex
- Usually revision needed

Lateral compartment degeneration

- 25% indication revision in swedish register (Robertson)

Wear

- Long term f-up MB: limited
- Long term FB: limited but higher percentage
- 45% indication revision in swedish register (Robertson)

19

Complications Uni

Loosening after 10 yr f-up: 5-10%

- 25 % of revisions for loosening (goe corr 03)

Fracture component: infrequent

Bearing dislocation mb medial

- Rare (Murray)

Bearing dislocation mb lateral

- 10.5% Robinson (knee 02)

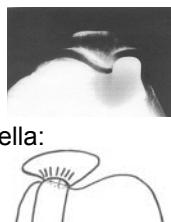

20

Complications Uni

Hernigou (jbjs 02): Patellofemoral problems

Progression OA:

- 35% after medial hemi
- 12% after lateral hemi

Impingement of femur on patella:

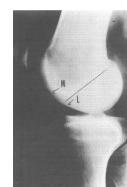

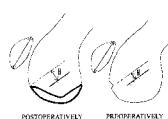

- 40 % in lateral hemi
- 24% in medial hemi

21

Complications Uni

Impingement: patellofemoral symptoms

Causes impingement: femur component proud of trochlea-condylar junction

Junction

- Medial : 3 mm above Blumensaat
- Lateral 4 mm below Blumensaat

22

Revision after Uni?

Gill (corr 95): TKA after Uni/HTO

- More bone reconstructions needed
- Exposure easier than after HTO
- Knee scores somewhat less than after HTO

Lai, Rand (corr 93)

- 81% good results after revision uni – TKA
- Predictable surgery

Padgett, Insall (jbjs 91)

- Revision TKA after uni is not simple

23

Revision after Uni ?

Levine (j arthr 96): TKA after hemi 29 patients

- 7 contained bone grafts
- 4 tibial wedges
- 2 femoral wedges
- Better than TKA after HTO
- Comparable with primary TKA:

McAuley, Engh (corr 01): n=39

- 10 bone graft,
- Primary femoral components
- 14 stemmed tibia components,
- 8 tibia wedges
- Better than revision TKA

24

Revision after Uni ?

Jackson (j arthr 94): uni vs HTO

- TKA after HTO: difficult approach, more serious complications
- TKA after uni, tibia bone loss
- Clinical scores similar

Chatain (rev chir 04): 54 revisions

- Better than after TKA and HTO
- Tibial stems necessary in bone defect
- → usually easy to do with good skills

25

Revision after Uni ?

Robertsson (acta scand 00):

- Better patient satisfaction than after TKA revision
- Not completely comparable with primary TKA:
- Tibia stem/wedges/bone graft

26

Conclusions Uni

Survival rate slightly less than TKA
(*but revisions are more often performed!*)

Faster recovery, smaller operation, better function, less serious complications

Mini invasive: effective after learning curve

MB vs FB Uni:

- less wear
- survival slightly better with good operative technique
- bearing dislocation rare

27

Conclusions Uni

Lateral oa: ?

Limited slope tibia and slight undercorrection of axis deviation important

Better than HTO in elderly inactive patients

Revision after uni

- effective with stem, bone grafts,
- patient satisfaction better than after total knee revision

28

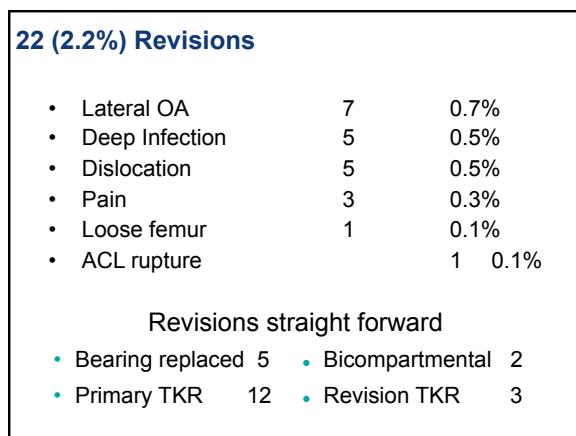

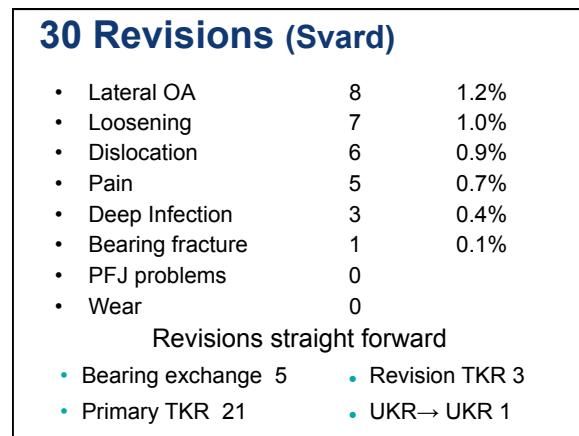

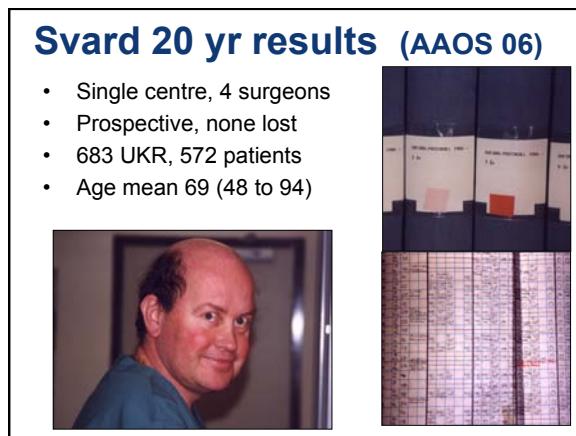

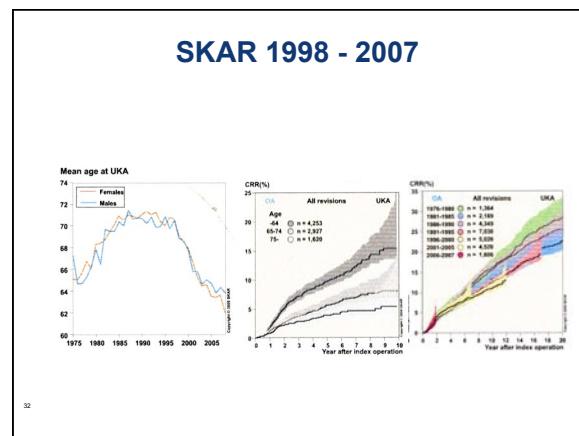

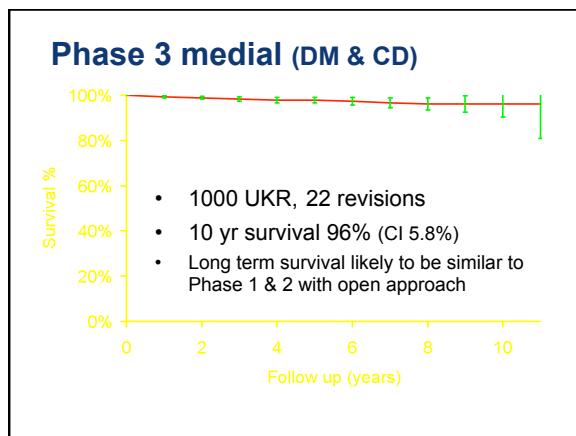

Indications Uni

- Correctable varus < 10 degrees
- Intact ACL
- Intact lateral compartment
- Asymptomatic patellofemoral joint
- < 10 dgr ffc, > 90 dgr flexion
- Not in case of inflammatory disease

29

Thank you for your attention

Mobile Lateral

- Starke Beugung
 - Femur subluxiert posterior
 - Konvexes Tibiaplateau

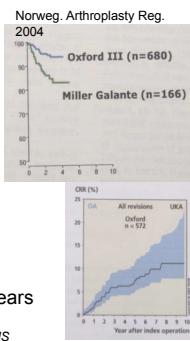

Domed Tibia

- Verstärkt Führung
- Modifizierte Technik
- Klinische Studie
 - Freie Beugung
 - Keine Luxationen
- Verfügbar für Spezialisten

Unicondylar Knee

Mobile bearing – high congruency

Reduction of shear and abrasion

Revision rate under 10 % over 15 years

Unicondylar Knee- Results

HTO for varus malalignment

Bony deformity? Age /Activity?

The ideal candidate - HTO

- under 55-65 years
- Varus tibia (TBVA >5°)
- ACL, PCL may be deficient
- BMI < 30
- Lateral side intact
- ROM normal, extension deficit may be corrected
- No nicotine abuse
- Pain tolerance

Cochrane Database :

Brouwer et al 2007

Silver Evidence:

70% of patients have benefit from an osteotomy for 10 years

Results Osteotomy

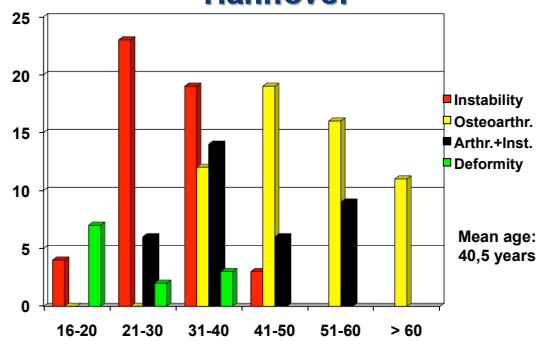

Babis et al, JBJS-A (8), 2002

- 29 double osteotomies planned with computer simulation (OASIS)
- follow-up 83 mo. (27-137)
- 96% survival rate (49 mo.), 1 total knee
- Knee Society Score 34 preop, 90 at follow-up

Conclusions

- These studies demonstrated favourable results after Tomofix
- The results are better than reported in the literature
- The revision rate was minimal (1,7%)
- The results were comparable with Uni and Total Knee
- Osteotomy must be viewed different in the present and future

Age distribution knee osteotomy Hannover

- 4 patients: 3 years after HTO
- **3 patients on waiting list for total knee**

Studies Tomofix

Salzmann GM, Imhoff, AB et al AJSM 2009

65 patients Tomofix 36 months postop

91% engaged in sports activity

2 sessions /4 hours per week

Lysholm 70, Tegner 4,3

Downhill skiing, mountain biking

Studies Tomofix

Niemeyer, P., Suedkamp, NP et al Arthroscopy 2008

43 patients 24 months postop

68% excellent / good

68% returned to predisease sports

86% clinical improvement at 24 months

Main improvement between 6 and 12 months

1 revision surgery (delayed healing)

Studies Tomofix

Takeuchi, R. et al, KSSTA 2008, 2009, Arthroscopy 2009

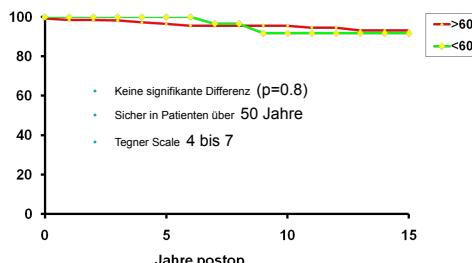

Simultaneous bilateral opening-wedge high tibial osteotomy with early full weight-bearing exercise

Clinical results and radiographical evaluation of opening wedge high tibial osteotomy for spontaneous osteonecrosis of the knee

Medial opening wedge high tibial osteotomy with early full weight bearing

Oxford im Alter < 60 Jahre

(Mittelw. 55, n=52, Price et al ESSKA 2000)

Survival hemi ?

Murray (jbj 98) oxford med

- 98% 10 year n=143, 1 disl.

Svard (jbj 01) oxford med

- 10 yr f-u: 95%

Tabor (j arthr 98) marmor fb

- 10 yr f-up 84%
- 15 yr f-up 79%

69

Survival hemi ?

Robertsson (acta scand 99) swedish registry

- CRR tka = 12 %, CRR hemi = 16%, cheaper, less serious complications

Naudie (jbj 03) Miller Galante FB med

- 10 yr f-up: 90% survival

70

Survival hemi ?

Squire (corr 99): marmor

- 15 yr f-up: 10% survival
- 46% had increasing lateral oa
- 10 % had Tibial loosening and wear

Gioe (corr 03) : am registry 516 hemi

- 5 yr f-up: 92%
- 10 yr f-up: 88%
- 51% lateral oa
- 25% loose
- 20% pe wear

Bert (j arthr 98): medial fb

- 87% 10 yr f-up, 10 % revision for lateral oa

71

Survival hemi ?

Argenson (jbj 02)

- 94% 10 yr f-up
- 3x pf oa
- 2x pe change
- 1 progr. Lateral oa

Deshmukh (corr 01) overview results

- Survival from 85-98%
- No big difference with mb/fb
- Recent mb studies strict inclusion/oerative technique better

72

Younger patients with hemi ?

Tabor et al (j arthr 99):

- 16% revisionrate 10 YR younger patients < 60 yr

Pennington (jbjs 03):

- 11 yr f-up: 93% survival Miller Galante FB med
- Average age 54 yr

→ ? Reservations !

73

Posterior slope and acl in hemi ?

Hernigou (jbjs 04)

- Relation slope and anterior tibia translation
 - Normal slope (< 7 degr) = normal ap laxity
 - > 13 degr slope: acl # and revision
 - In presence of acl # and limited slope: 11/18 patients good function

→ Conclusion: slope is important , not too much

74

Over/undercorrection leg alignment ?

Ridgeway, Engh (jbjs 02):

- Undercorrection and small pe: more failure
- Correct restoration joint kinematics and laxity

Hernigou (corr 04):

- Overcorrection: increase degeneration lateral side of the knee
- Undercorrection: increased wear of PE

→ axis between 1-9 dgr varus in medial oa is best

75
