Ciao Pierrot

MORPHOTYPE ABNORMALITIES IN CHILDHOOD

Lower limb deformities

INTRODUCTION

Complex notion of "normality"

Ancient study => Few cases

Recent Big Data Scanner Study

Interest of EOS (radiation)

Knee Surgery, Sports Traumatology, Arthroscopy

Osteotomies around the Knee
Indication–Planning–Surgical Techniques using Plate Fixators

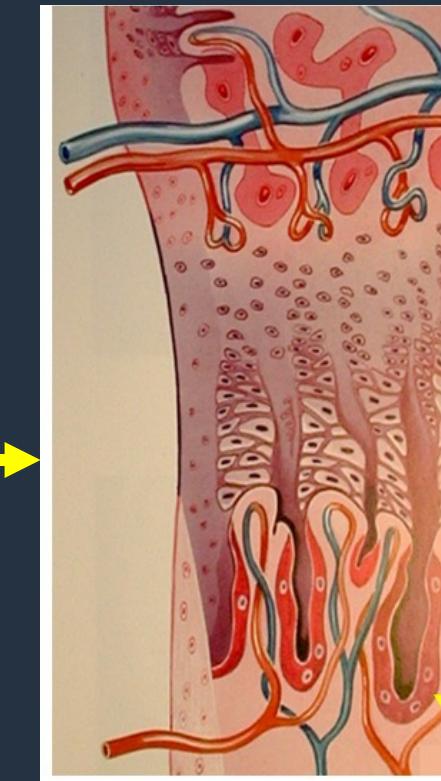

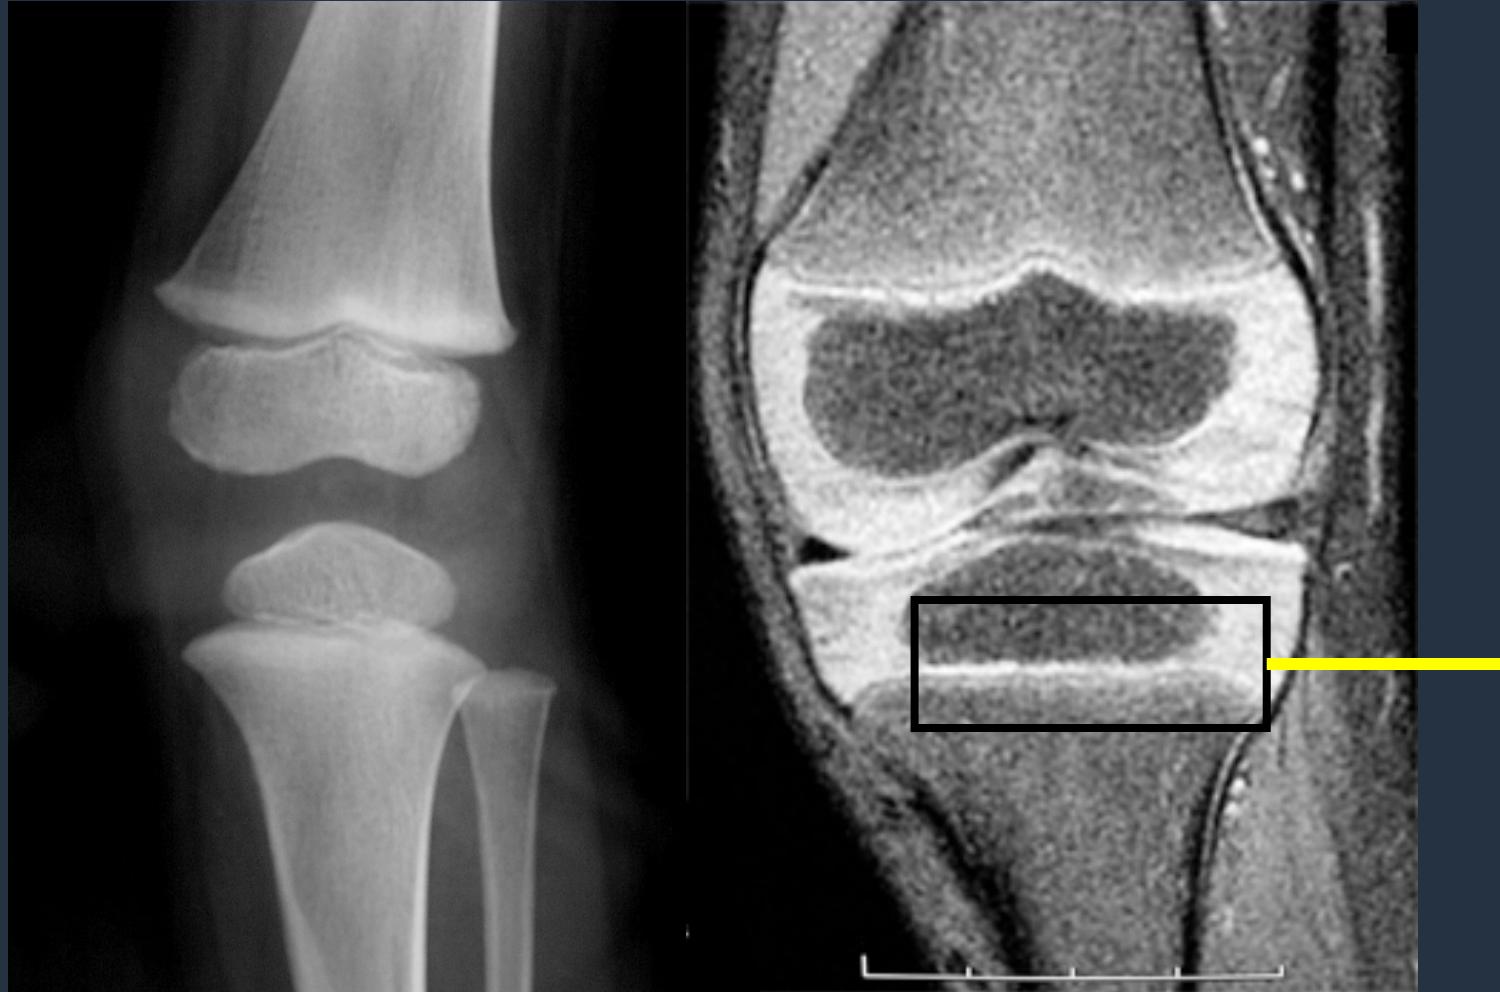

A grid of nine images related to knee surgery. The top row shows a surgeon's hands, a patient's leg during surgery, and a post-operative X-ray. The middle row shows a surgeon's hands, a patient's leg during surgery, and a post-operative X-ray. The bottom row shows a surgeon's hands, a patient's leg during surgery, and a post-operative X-ray. The rightmost image in the grid is a detailed anatomical diagram of the knee joint with various lines and measurements.

Long bone growth

- Away from Elbow
- Close to the knee
 - 70 % of the femur
 - 60 % of the tibia

GROWTH AROUND THE KNEE

- Zone germinale
- Zone de croissance
- Zone d'hypertrophie
- Zone d'ossification
- Travée osseuse

Appearance of Knee Growth Cartilage in Radiology and MRI

MORPHOTYPE ABNORMALITIES IN CHILDHOOD

"NORMAL" MORPHOMETRY

CORONAL MORPHOLOGICAL ABNORMALITY

SAGITTAL MORPHOLOGICAL ABNORMALITY

TORSIONAL MORPHOLOGICAL ABNORMALITY

CLINICAL EXIMINATION

Bilateral Comprehensive Clinical Examination

Global Lower Extremity Alignment

Dynamic assessment achieves of:

- Ligament stabilizers
- Musculotendinous
- Meniscus
- Cartilage

Increases deformation

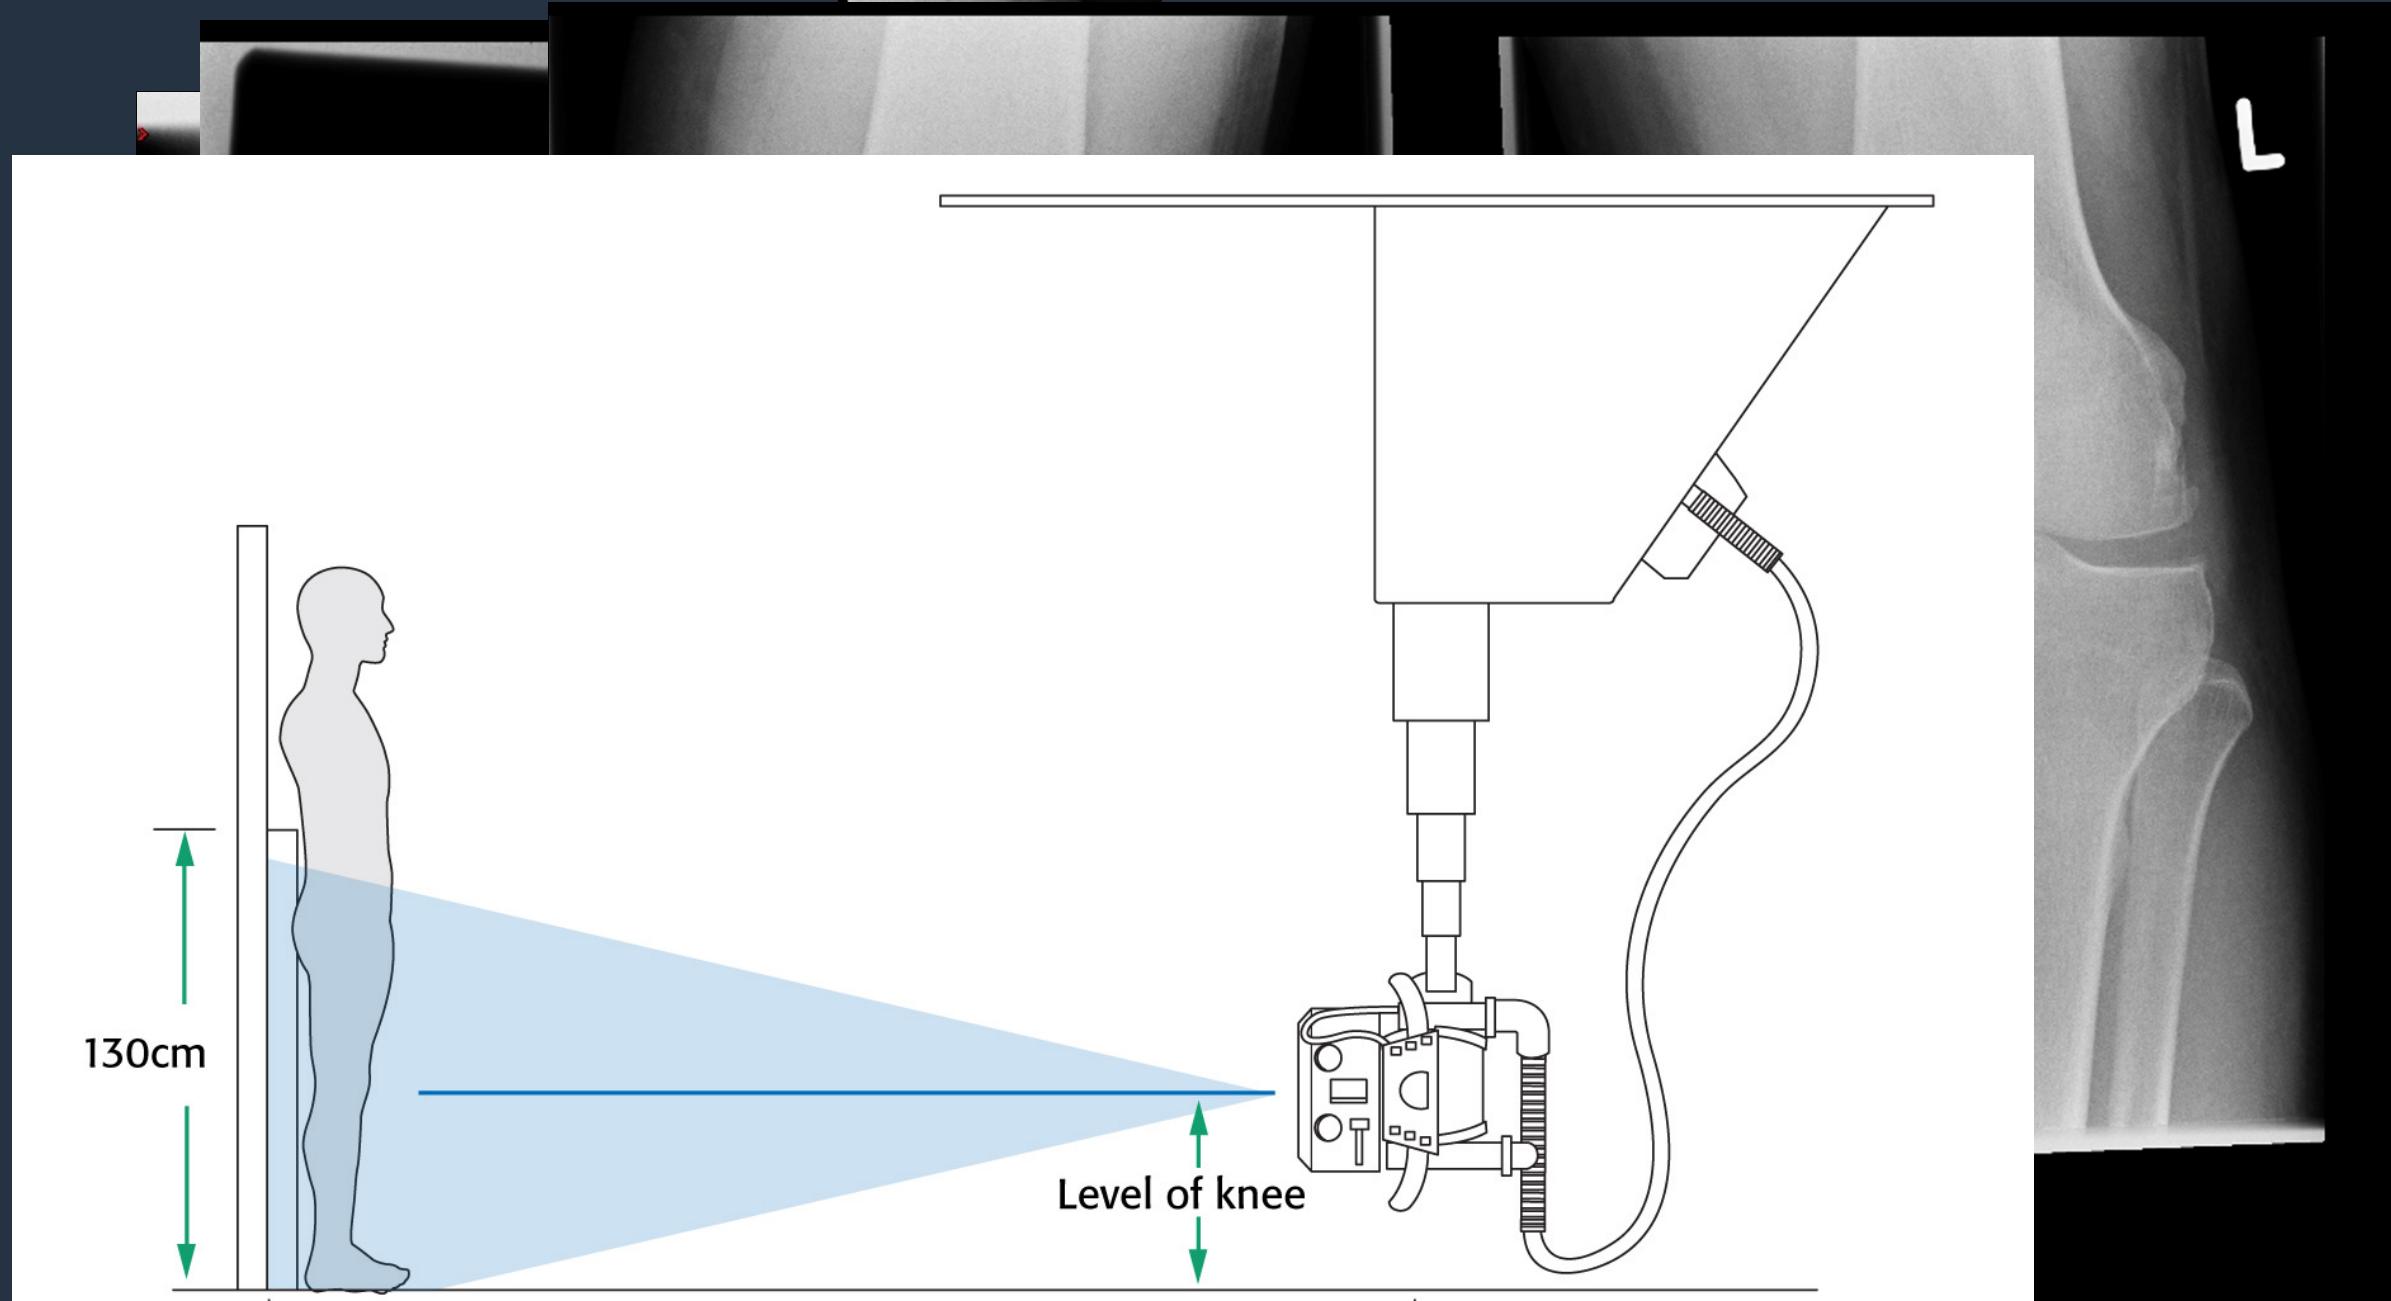

NATURAL EVOLUTION OF THE FRONTAL MORPHOTYPE

3 phases

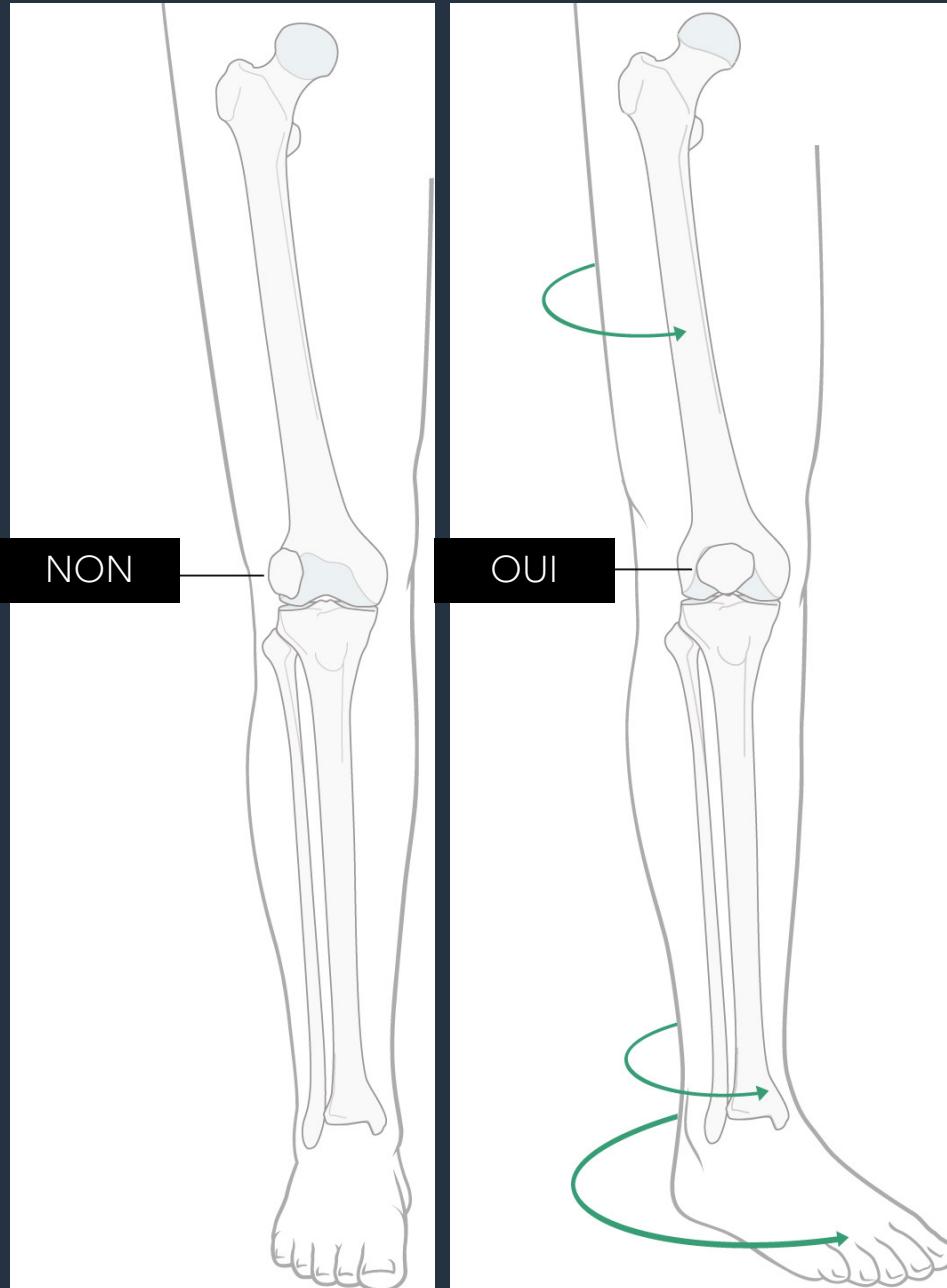

0 - 2 ans : Genu varum gradually decreases

2 - 10 ans : The Genu Valgum is max at 3 years old (girl) and 4 years old (boy). Then it gradually decreases

>10 ans : TENDANCY to Genu Valgum (girl), Genu Varum (boy)

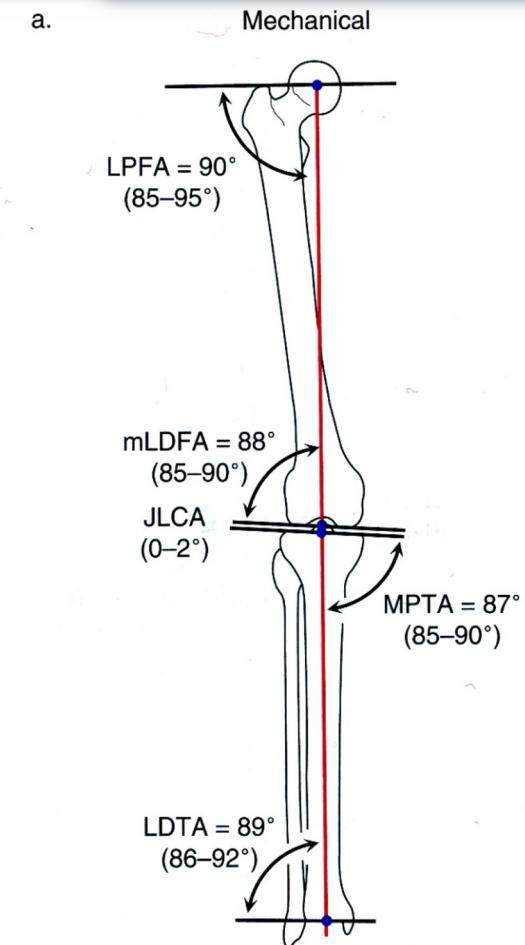

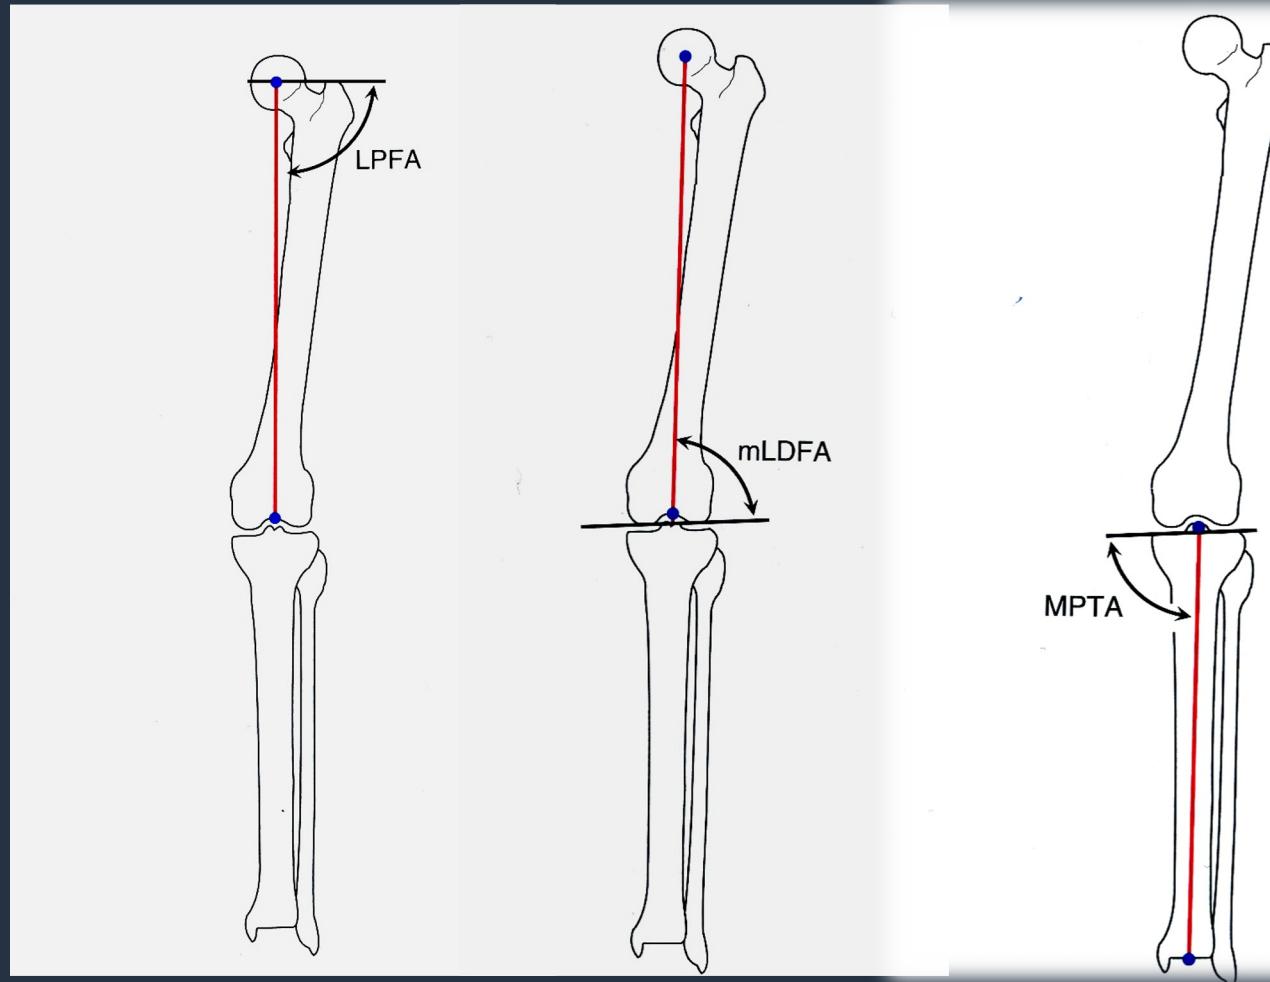

ORIENTATION WHEN SHOOTING

INTERNATIONALE NOMMENCLATURE

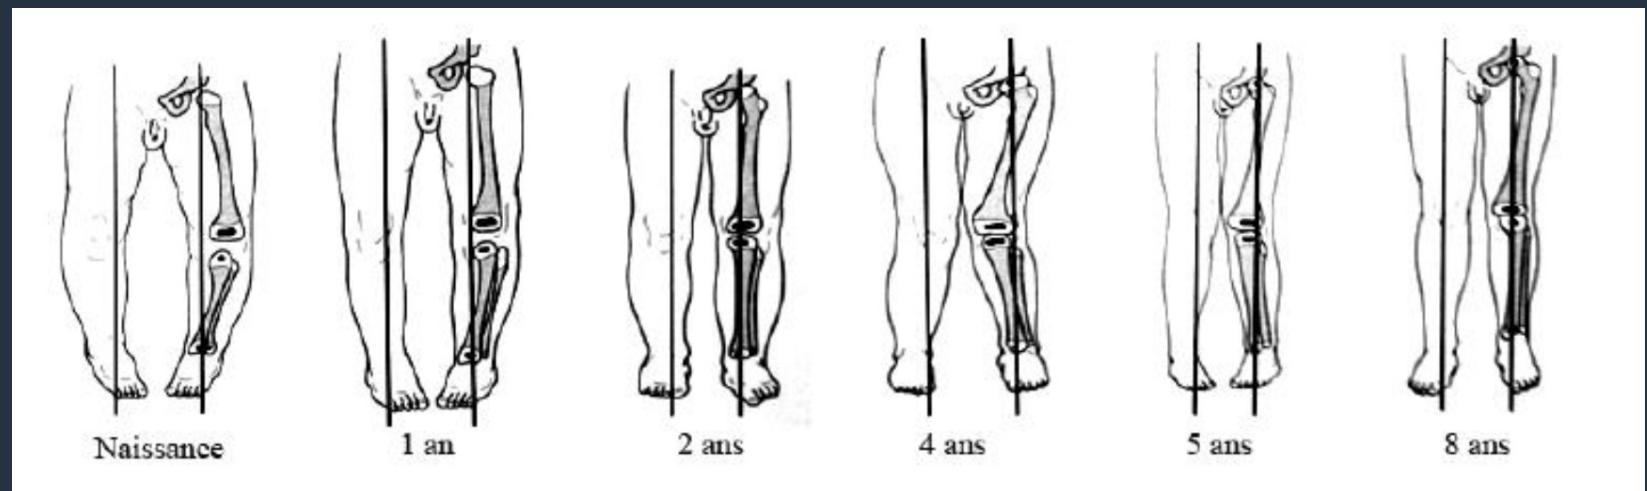

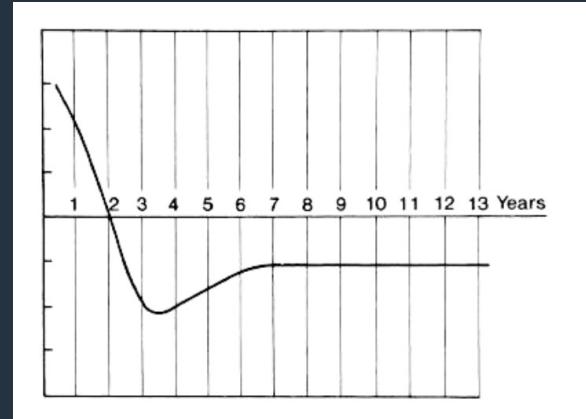

- m : mechanical
- a : anatomical
- L : Lateral
- M : Medial
- P : proximal
- T : tibial
- F : fémoral
- A : Angle

MORPHOTYPE ABNORMALITIES IN THE FRONTAL PLANE

The legs axis evolves until the age of 7!

- Genu varum in small children
- Genu valgum under the effect of weight-bearing (acquisition of gait)
- Then stabilization around 7 years old

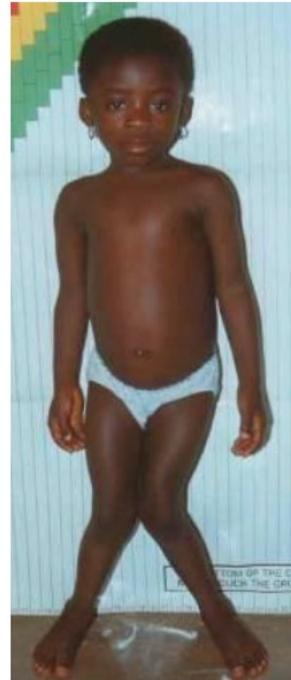

MORPHOTYPE ABNORMALITIES IN THE FRONTAL PLANE

Genu varum

Rotules au zénith
Contact intermalléolaire
Ecart intercondylien

Genu valgum

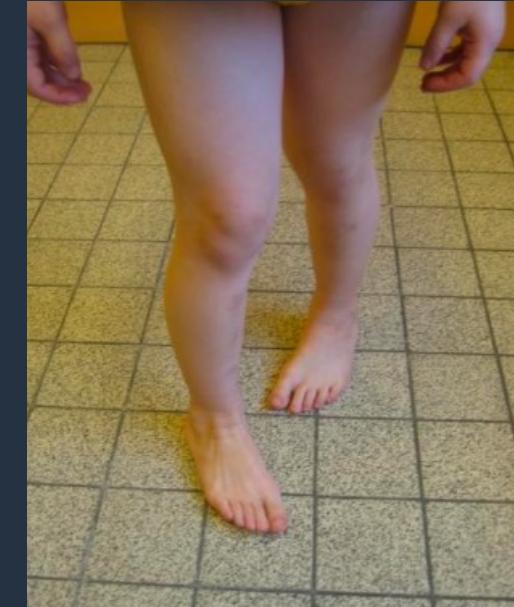

Rotules au zénith
Contact intercondylien
Ecart intermalléolaire

DIFFERENT FROM MORPHOTYPE ABNORMALITIES IN THE HORIZONTAL PLANE

Common reason for consultation

- "Spinning" feet (steps in or out)
- Often related to a femoral or tibial torsional abnormality
- « Heavy » surgical osteotomies sometimes needed

MORPHOTYPE ABNORMALITIES IN THE FRONTAL PLANE

False genu VALGUM
Due to adolescent overweight

MORPHOTYPE ABNORMALITIES IN THE FRONTAL PLANE

Is deviation:

- Bilateral
- Symetrique

Is there a cause to the deformation ?

Traumatic

Infection

Rickets

Blount disease

MORPHOTYPE ABNORMALITIES IN THE FRONTAL PLANE

Is deviation:

- Bilateral
- Symetrique

Is there a cause to the deformation ?

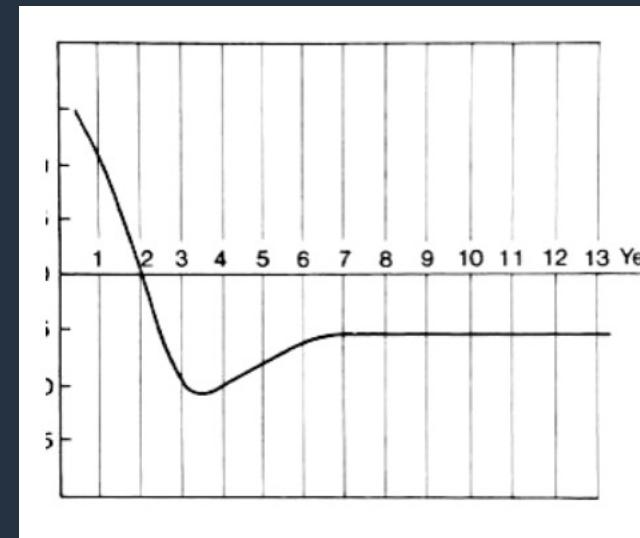

What are the consequences ?

- Falls
- Pain

MORPHOTYPE ABNORMALITIES IN THE FRONTAL PLANE

Most of the time the deviation is :

- Bilateral & symmetric
- No identified cause
- Not symptomatic / no consequences

FRONTAL MORPHOTYPE IN VARUS

Clinical examination: Intercondylar gap

- Stand, knees extended, knee caps strictly facing
- or small children, easier lying down

ETIOLOGY

- Physiological (<2 years)
- Idiopathic
- Secondary
- Blount's Disease
- Constitutional Bone Disease
- Deficiency rickets, vitamin-resistant
- Post-traumatic stress disorder
- Post-infectious

* Any asymmetrical varus is a priori pathological

* Any genu varum that continues to worsen after the age of 2 years should be considered pathological.

* In pre-adolescents, a genu varum with an intercondylar distance > 3cm should be considered pathological.

Blount's disease: deformity of the prox and medial epiphysometaphyseal region of the tibia

Achondroplasia: association with short stature

FALSE GENU VALGUM

Trap: False genu varum due to femoral antetorsion and knee recurvatum

=> disappearance of the genu varum in anatomical position, patellas strictly opposite

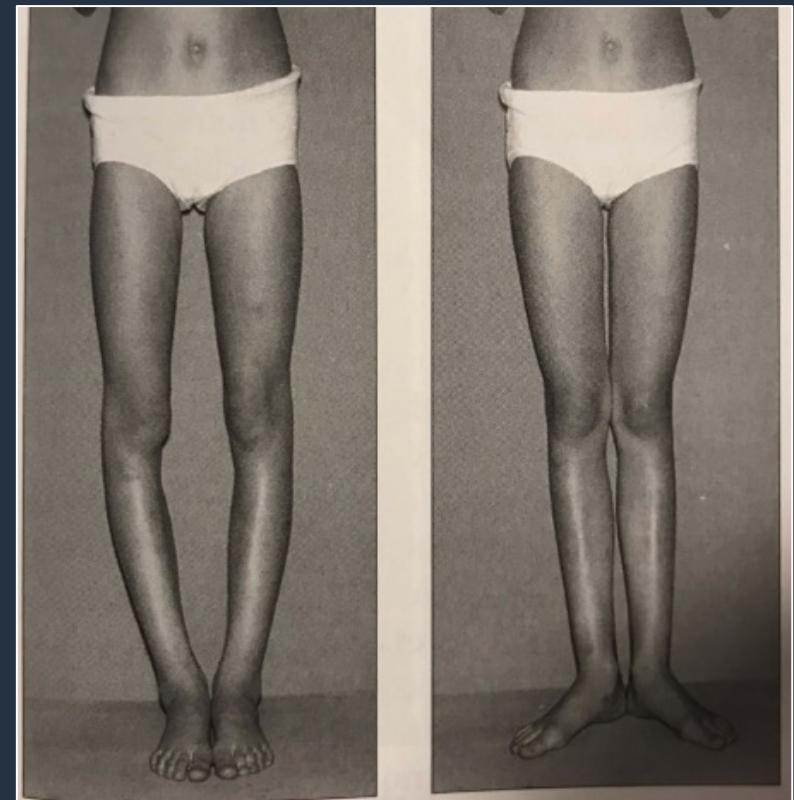

Fig. 11.2 – Faux genu varum par hyperantétorsion fémorale et récurvatum du genou.

FRONTAL MORPHOTYPE IN VALGUS

Clinical Examination: Intermalleolar Gap

- Stand, knees extended, kneecaps strictly facing
- For small children, easier lying down

- Physiological (3-4 years)
- Idiopathic
- Secondary
- Constitutional Bone Disease
- Deficiency rickets, vitamin-resistant
- Post-traumatic st

- Any asymmetrical defect is a priori pathological.
- Any genu valgum that continues to worsen after the age of 4 should be considered pathological.
- In pre-adolescents, a genu valgum with an intermalleolar distance > 8cm should be considered pathological
- Trap: false genu valgum of obese children

POST-TRAUMATIC FRONTAL DEFORMITIES

Metaphyseal fracture of the proximal tibia

Growth Cartilage Injury: Epiphysiodesis

- Central total or partial epiphysiodesis

Length unevenness without misalignment

At the knee: varus by fibula growth

- Peripheral epiphysiodesis

Varus or valgus misalignment

Recurvatum

Flexum

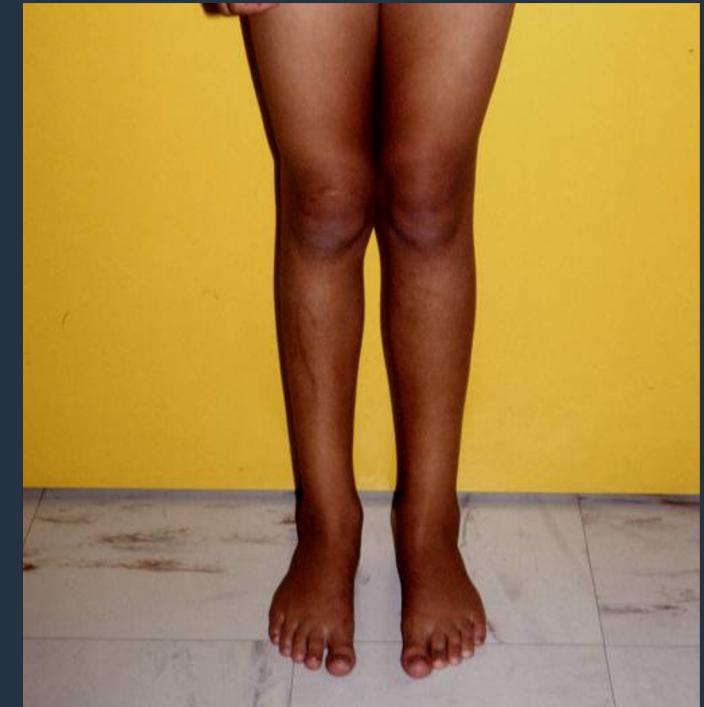

METAPHYSEAL FRACTURE OF THE PROXIMAL TIBIA

Isolated fracture
upper tibia, 4 years

Bone healing
Valgus developed in 6 months

Spontaneous evolution
+ 5 years

TREATMENT OF FRONTAL DEFORMITIES IN CHILDREN

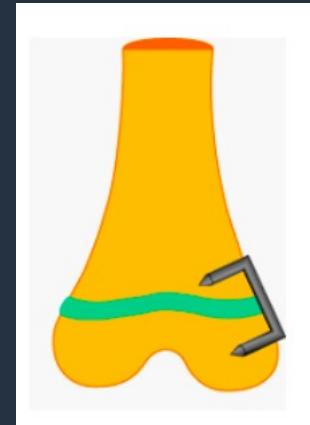

Physiological axis deviation for age

- no additional examinations
- no treatment (no pathology...)
- explanations of growth
- monitoring

Pathological axis disorder

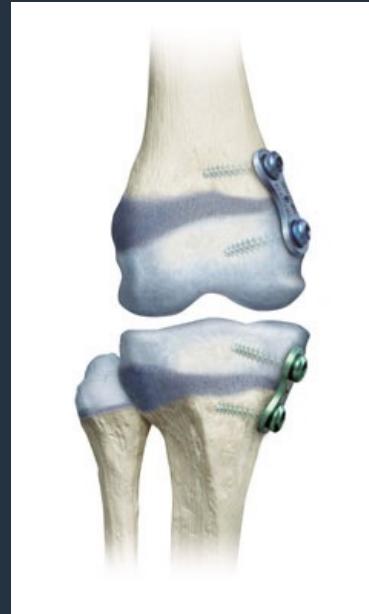

- Hemi-epiphysiodesis at the end of growth
- Etiology treatment

SURGICAL TREATMENT OF FRONTAL DEFORMITIES IN CHILDREN

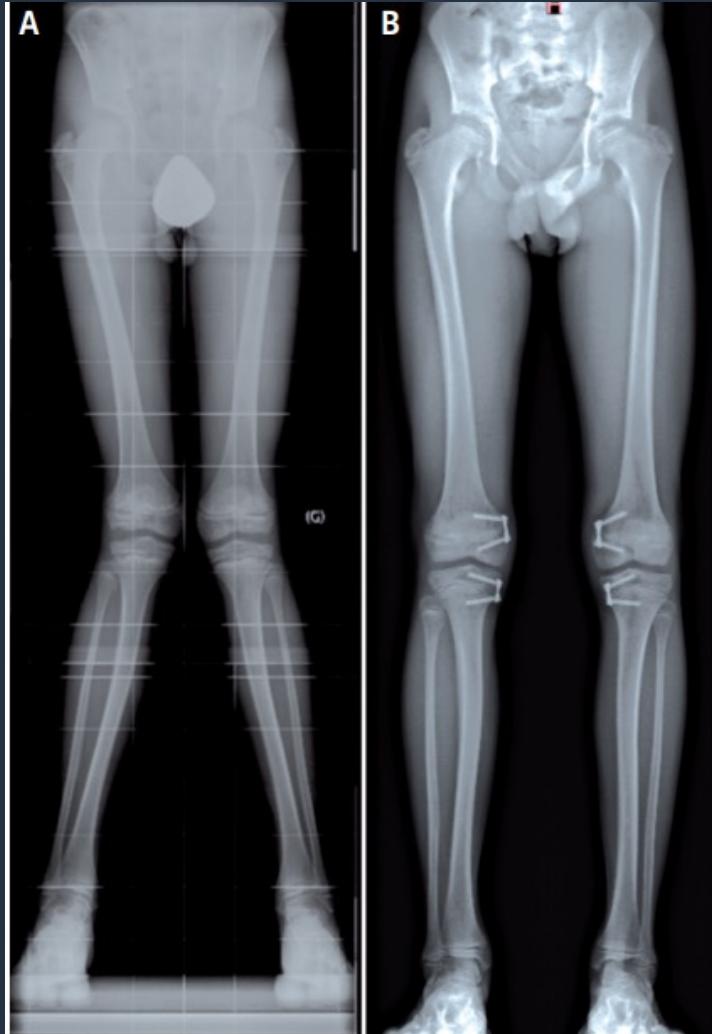

Hemi-epiphysiodesis or figure-8 plate-guided growth

- Femoral and/or tibial valgum genu: internally
- Genu varum femoral and/or tibial: external

After the end of growth, there is no other solution than to do corrective osteotomies

EXAMPLE: SYMMETRICAL IDIOPATHIC GENU VALGUM MODULATION OF GROWTH BY HEMI-EPIPHYSIODESIS

- Indication: Intermalleolar gap > 8 cm
- Bone age: 11 years (girl), 13 years (boy)
- Ablation of the plate once normo-focused

Regular monitoring:
Clinical follow-up /6 months
Photographs

IATROGENIC EFFECT OF ACL RECONSTRUCTION CHILDREN / ADOLESCENT ?

ALL / Tenodesis is (for us) required < 18 yo

We do not graft Antero Lateral Ligament < 12 YO ... but we do a **LATERAL TENODIS** to avoid Tibial tubercle growth.
Disturbance if < 12 YO

... or we go for Mac FL combined ACL -ALL reconstruction intraphyseal femoral reconstruction / over the top

In practice

Quantify the residual growth potential

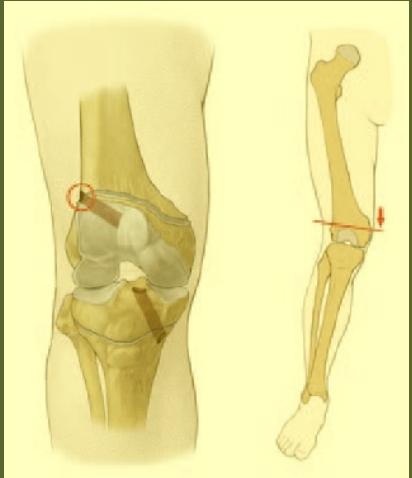

MANDATORY +++

Potential growth disturbances in pediatric ACL reconstructions

4 types of gross complications

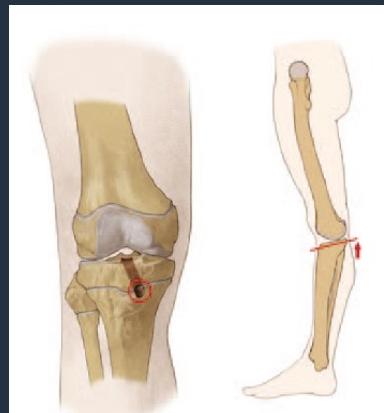

N = 354 in the literature

Moksnes, Engebretsen, Seil, KSSTA 2015

GABIN S - 12 YO / 2015

- 12 YO un 2015
- Left knee injury
- FOOTBALL knee injury , 2 training. & 1 game / week
- LACHMAN ++, ant. Drawer + , « General Hyperlaxity » , PM knee pain (meniscal lesion)

INITIAL X_RAYS : LONG X-RAYS+ OSSEOUS AGE

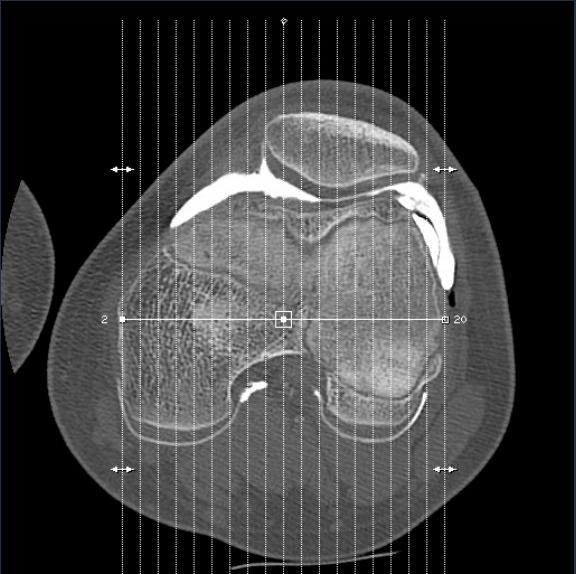

GABIN S / 2015

- 0,5 ° of valgus (HKA)
- Iso lenght
- Osseous age : 12 ½
- 3 months of physion : UNSTABLE & UNABLE to play soccer
- JULY 2015 : ACL-rec w. ST4 Hamstrings + vert. Post men lesion = suture 2 anchors

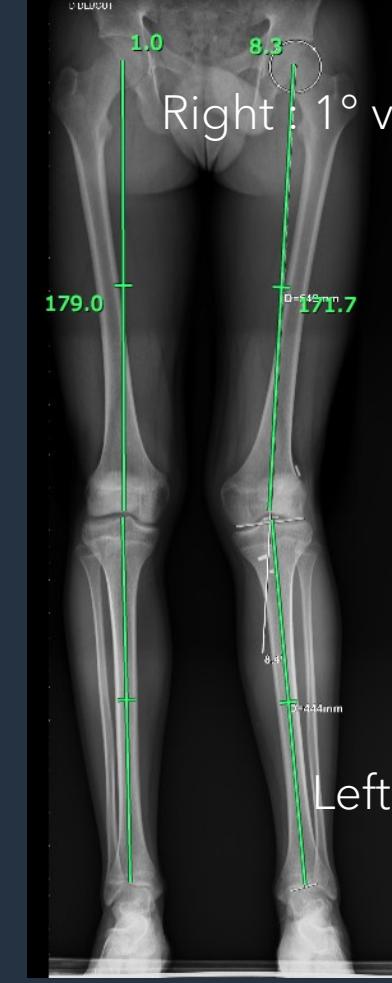

GABIN S / 2017

- Bucket handle of the repaired medial meniscus
- Partiel medial. Menisectomy 2/3 of the meniscal body

X_RAYS SURVEY : 2023 ,

12° of TIBIAL SLOPE

8° RESIDUAL VALGUS

- Correct it or not ?
- Can not play soccer ... but like biking
- Still on survey ...
